Evidence, in warm color

A Metropolis theme in the ffloyd palette

An illustrative research presentation

October 2026

A quiet background. A clear visual hierarchy.

Soft cream gives the page its tone. Deep blue anchors the structure. Golden yellow draws attention; jade green marks examples.

Gold Jade Blue Terracotta Violet Rose Olive Deep blue

Categorical Distinguish groups without implying rank.

Sequential Let darker values indicate more.

Diverging Compare departures on either side of a reference.

Ideas and notation

From a research question to a measurement

What would we want to know?

- Who uses each transport mode?
- How does service change over time?
  - Compare districts consistently.
  - Keep the measurement scale fixed.
- Which areas improve or decline?

A simple analytical workflow

1. Define an outcome and population.
2. Establish a meaningful baseline.
3. Estimate the change and uncertainty.
4. Separate evidence from interpretation.

All examples in this deck describe a fictional mobility study.

Mathematics with a focused accent

Let $Y_i(d)$ denote a potential outcome and $D_i \in \{0, 1\}$ treatment status. The average treatment effect is

$$\tau = \mathbb{E}[\, Y_i(1) - Y_i(0)] \,.$$

A working regression and its least-squares estimate are

$$Y_i = \alpha + \tau D_i + \mathbf{x}_i^\intercal \boldsymbol{\beta} + \varepsilon_i,$$

$$\widehat{\boldsymbol{\theta}} = \arg\min_{\boldsymbol{\theta}} \sum_{i=1}^{n} \big(Y_i - \mathbf{z}_i^\intercal \boldsymbol{\theta} \big)^2.$$

Interpretation

Under random assignment and the relevant causal assumptions, $\widehat{\tau}$ estimates the average effect of treatment.

Blocks, examples, and alerts

Main result

Put the claim and its scope together. Use the blue block for definitions, propositions, or a result the audience should retain.

A qualification that matters

An association alone does not establish causation. Gold highlights the point while the supporting text stays blue.

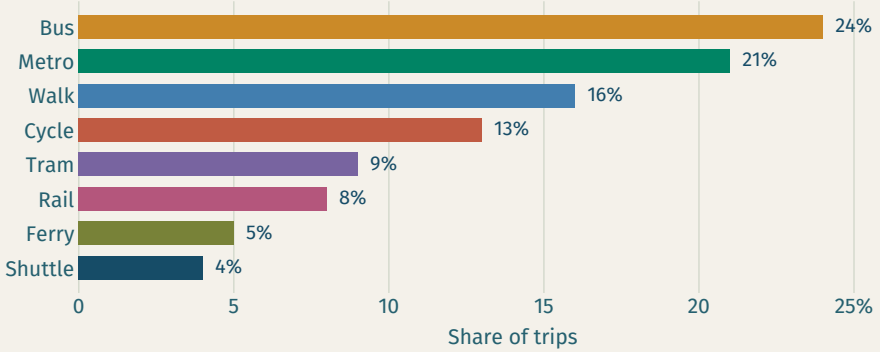

A concrete example

Compare the same outcome across two randomly assigned groups, then report an estimate alongside its uncertainty.

Three views of the data

Categorical: different modes, distinct identities

A fictional survey records the main mode used for each trip.

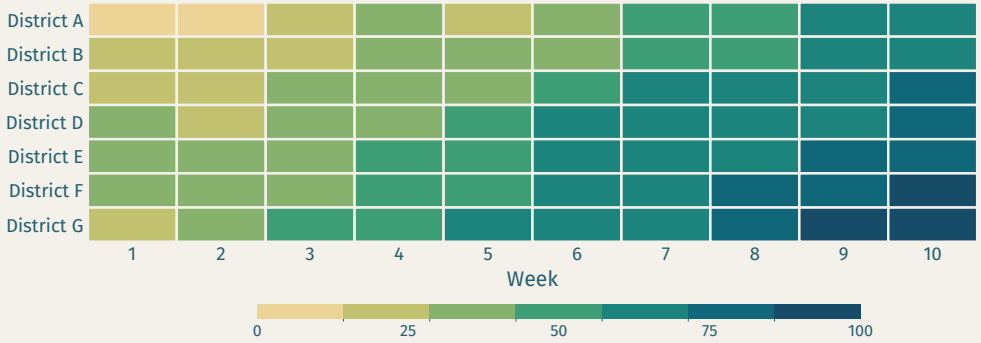

Eight categories; the complete categorical palette.

Synthetic data; illustrative only.

Sequential: service builds over time

Availability index: 0 means least service; 100 means most service.

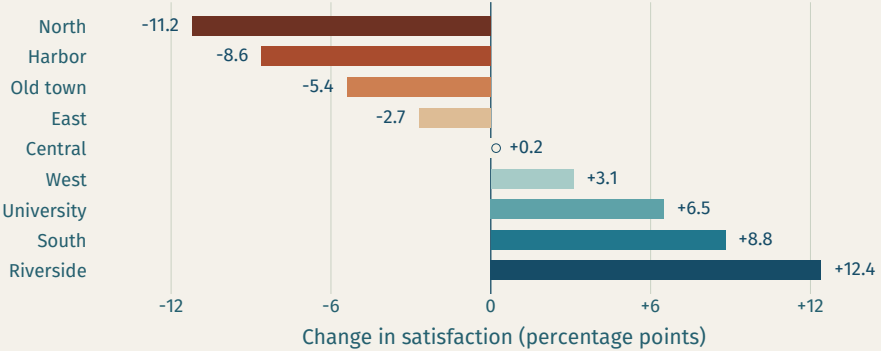

Seven ordered colors; a common 0–100 scale across every district.

Synthetic data; illustrative only.

Diverging: changes on either side of zero

Differences in satisfaction relative to the baseline, by service area.

Nine colors centered on zero; warm below, cool above.

Synthetic data; illustrative only.

A compact result table

Area	Change	95% interval
North	-11.2	$[-14.6, -7.8]$
Central	$+0.2$	$[-2.1, +2.5]$
Riverside	$+12.4$	$[+8.9, +15.9]$

Synthetic estimates and intervals; percentage points.

Read the estimate with its uncertainty.

- Report the unit and reference.
- Show the interval with the point estimate.
- Near zero can still be informative.

Use the theme in your next deck

```
\documentclass[aspectratio=169]{beamer}
\usetheme{ffloyd} % cream by default
% Or: \usetheme[background=white]{ffloyd}
% Or: \usetheme[background=softcream]{ffloyd}

% Inside your slides:
\alert{An important point}
\textcolor{ff_green}{An example}
```

Keep the two theme files and `ffloyd_colors.tex` with your deck. Compile with LuaLaTeX for Metropolis's Fira typography.

Based on Metropolis by Matthias Vogelgesang and contributors. Theme adaptation: CC BY-SA 4.0.

Keep the evidence clear.

Give the important point a little gold.
